On the Experience of Reason & Truth

In short I'll begin w/ this, ప్రారంభంలో మాటలు. ఆలోచనలో మాటలు, వస్తువులో ఉంది. That is to say before words, language, objects, identity, or sound there is only the physical universe in all it's (or its) glory. Everything we then construct including language, objects etc. are all ultimately that, constructs subject to all the physical laws, what's interesting about this then is that all things including relations, lives, and anything you can think of being built are therefore physical constructs in a way. Though this seems to me in 2026 (the future) hard to comprehend I'm none the less here by the guidance of my own vision and Logic (or logic). The only way I can reconcile this is that either (in order of my belief) 1) Our definition of Physics is too narrow and perhaps not sufficiently relational or focused on the intangible concepts or 2) I've cracked (in the sense that an assumption upstream is quite wrong) Given that I've retained my sense of humour and my reasoning seems quite reasonable, I'm happy to conclude that for now it's more likely 1) than 2). Allow me to finish off w/ a demonstration/my visual.

(I was thinking about the Moral Imperative)

Side Note: Kant (and actually everybody) first experiences a truth, a reality, enlightenment, brain expansion, conclusion, etc. then spend about 20 years explaining why that actually is the truth, whereas I figure, why not just live out your truth and if you're right 1) You teach to the experience and 2) You don't have to convince anyone they'll convince if you're actually in a lower energy state. and 3) If you're wrong and your interpretation was false you'll quickly find out. Basically you experience reason and truth long before you derrive, take a snapshot of it, or prove it. Basically what I'm saying is Truth and Reason are first experienced then conveyed. Yet we spend far too much effort in a non-dual universe conveying, simply living by your novel reasoning and listing your thoughts/logic should be sufficient. Reality is often quite simple and usually very logical, orderly, and passive towards itself, we're the ones who panic and kill ourselves/die by bringing to fruition the very things we fear by suppressing things out of fear, paying interest, and then blowing up on that account. It's honestly quite farcical when you really comprehend non-duality/it's all nature/ Cont. f.f. 1b.

1) How do you determine what's True and what's just rhetoric?
2) What is an economic mechanism which actually gets a resource to its most productive use?

1) That which is True survives over time because it's fundamentally aligned, as contexts shift therefore what's True changes, that which is untrue i.e. False, Rhetoric, etc. incurs a cost for misalignment which over time ultimately bankrupts itself. Truth is dynamically adapting and constantly fluctuating, what we call Truth then is often a snapshot of the Universe from which we can do "knowing" subject to a timescale constraint for how long a Truth may be valid. This effectively means every truth has an expiration date, therefore defining the timescale on which you're speaking is very important because the "trueness" of a statement will ultimately be contingent on that basis. Efficiency/Fitness therefore is the measure of all things. Stated differently we arrive at the question, "How much does it cost you to live out your truth?"

2) It can be said that resources are efficiently allocated when applied toward the solution of a real problem i.e. absorption or decomissioning of a source of variance. The constraint of course being one of matching the size/cost of the solution w/ the size/cost of the problem. In essence you view society through energy costs, where infrastructure investment is looked at and evaluated the same way as an exothermic reaction where you have an upfront endothermic cost, followed by a exothermic release and a new ground state that costs less energy to inhabit. Ultimately it can be said that the purpose of economics should be to get society into the lowest cost energy state via the tools and resources to which we have access. Ultimately agency and choice matter exactly as much under this paradigm as much as probability would do under the modern construction of quantum physical systems, as a something you respect and explicitly design around. This is in my view how many of the great statesman operated (Catherine, Bismark, Yew, Ashoka, Ravanna, Elizabeth, Walker, or even my own father and mother. It's a cycle of continuous improvement continuous deployment at all different scales, contexts, verticals, and so on, but the principle remains get to a lower and energy state where we more easily absorb the variance. The obvious model then is a self-similar DAG at all the various scales.
